

A scatter plot on a Cartesian coordinate system with a light gray dashed grid. The x-axis is labeled from -10 to 10 in increments of 5. The y-axis is unlabeled but has a grid extending from approximately -10 to 10. There are two main clusters of data points, each represented by semi-transparent shaded ellipses. The first cluster is pink, centered roughly at (-2, -5), and contains approximately 25 pink circular points with black outlines. The second cluster is green, centered roughly at (4, 0), and contains approximately 15 green circular points with black outlines. The two ellipses overlap in a central region, creating a brownish-gray shaded area. This overlap contains several points from both clusters, as well as a few points that appear to be misclassified or outliers. For example, one pink point is located at approximately (8, -2), and one green point is at approximately (-1, 8).
